

Sex differences, trait associations and moderation of autistic camouflaging

Hierarchical multivariate CAT-Q models pooled across 20 imputed datasets (N = 193)

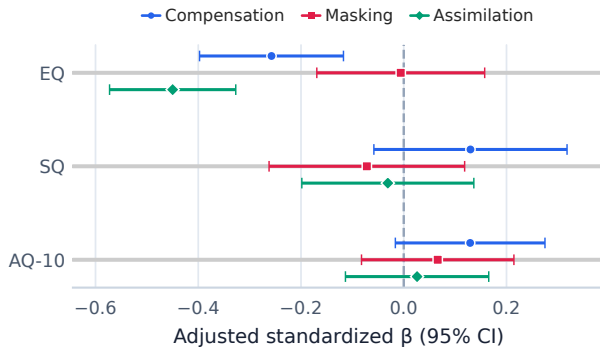

A. Sex coefficients before and after adjustment

Multivariate sex effect: M1 $q = .006$; M2 $q = .368$

C. Adjusted trait-subscale associations

Multivariate q : EQ < .001; SQ = .063; AQ-10 = .368

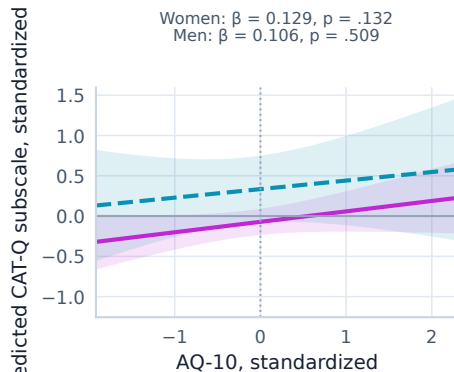

E. Sex-specific AQ-10 associations with CAT-Q subscales

Model 3 predictions at mean age, EQ and SQ; ribbons show pooled 95% CIs

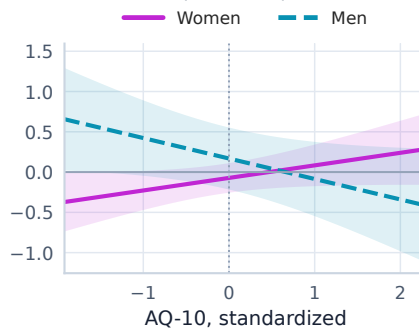

Compensation

Women: $\beta = 0.129$, $p = .132$
Men: $\beta = 0.106$, $p = .509$

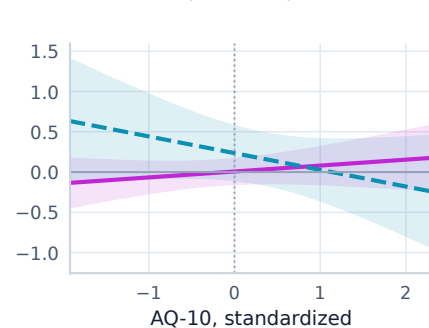

Masking

Women: $\beta = 0.156$, $p = .073$
Men: $\beta = -0.254$, $p = .056$

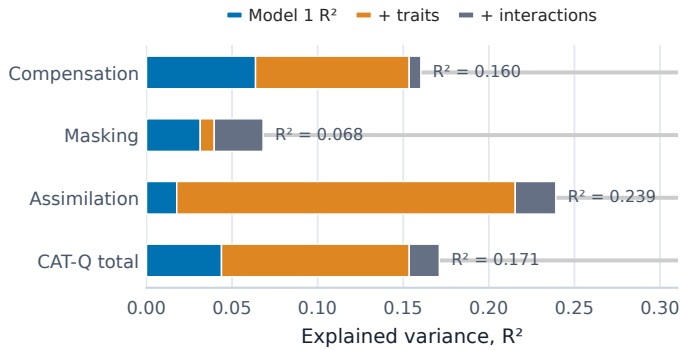

Assimilation

Women: $\beta = 0.073$, $p = .347$
Men: $\beta = -0.207$, $p = .197$

B. Incremental variance explained

Sequential contribution of Models 1–3
Masking interaction $\Delta R^2 = 0.029$

D. Sex-by-trait interactions

Sex $\times$ AQ-10 omnibus: $\chi^2(3) = 12.34$, $q = .025$
