

Interaction specificity and incremental explanatory value

CAT-Q models pooled across 20 multiply imputed datasets (N = 193)

A. Specificity of sex-by-trait interactions

Sex × AQ-10 omnibus: $\chi^2(3) = 12.34$, $q = .025$
Masking: $\beta = -0.410$, 95% CI [-0.722, -0.098]

B. Incremental variance explained

Segments show the sequential contribution of Models 1–3
Masking gained $\Delta R^2 = 0.029$ after adding sex interactions
